

I'm working on a compelling solution across databricks' genie products, and Domo. Provide me seven example ideas based on the latest most up to date databricks information and knowledge related to Genie and Unity catalog.

Here are seven concrete solution ideas that tie Databricks Genie (incl. Spaces, "Genie everywhere", external knowledge, Genie Code) and Unity Catalog to Domo in ways you can actually sell and implement today. ^{[1] [2] [3] [4] [5] [6]}

1. UC-governed "Genie → Domo AI Hub" semantic layer

Use Unity Catalog as the single governed semantic layer feeding both Genie Spaces and Domo datasets, then expose the same business logic through Domo AI features and cards. ^{[2] [7] [8] [6]}

- Define business entities, metrics, and joins in UC (comments, constraints, gold views) and tune them for Genie accuracy and speed. ^{[7] [9] [2]}
- Create Gold views (Star/Snowflake) in Databricks, registered in UC, and pipe those into Domo via the Databricks-Domo connector or JDBC; Domo then sees a curated, governed model identical to what Genie is using. ^{[8] [10] [6] [2]}
- Positioning angle: "One governed semantic layer in Unity Catalog, two consumption planes: conversational Genie inside Databricks, augmented dashboards and AI chat inside Domo, with no metric drift."

Example: Revenue, margin, LTV, churn and attribution are all defined once in UC, surfaced in Genie for NLQ exploration and mirrored in Domo as certified datasets and Beast Modes derived from the same SQL expressions from Genie Spaces. ^{[9] [6] [2] [7]}

2. Genie Spaces as analyst workbench, Domo as executive UX

Use Genie Spaces as the analyst-facing exploration surface, with auto-generated SQL and visualizations becoming the source for refined Domo production assets. ^{[11] [3] [12] [2]}

- Analysts ask Genie NLQ questions over UC-registered tables and metric views, iterating until the generated SQL and visualizations match business expectations. ^{[3] [12] [2] [11]}
- The final "trusted" Genie queries and SQL expressions become curated "trusted assets" and Gold views, which are then materialized and ingested into Domo as stable, scheduled datasets. ^{[6] [2] [9]}

- Workflow: Genie for hypothesis and pattern discovery → promote to UC Gold layer → Domo for pixel-perfect dashboards, alerts, and mobile distribution.

You can pitch this as “Genie accelerates BI development by 5–10x; Domo operationalizes the winning insights with governed refresh, wide distribution, and writeback.”

3. Actionable Genie with Domo writeback agents

Leverage Genie’s new external action capabilities (MCP-style connections via the Unity Catalog AI Gateway) to call Domo APIs, closing the loop from analysis to action.^{[4] [1] [9] [6]}

- Register an action tool behind the Unity Catalog AI Gateway that calls Domo’s APIs (e.g., dataset refresh, alert tweaks, notebook or workflow triggers) under governed service principals.^{[1] [8] [4] [6]}
- From a Genie Space, a user can ask “Refresh the executive sales Domo dashboard and post a note if QTD bookings are below target” and Genie uses the Domo integration to trigger the right workflow.^{[4] [6] [1]}
- UC governs which Genie Spaces and identities are allowed to call which Domo actions, so you can tie this to data entitlements and environment boundaries.^{[8] [1] [4]}

This is a compelling “insight to action” story: Genie finds the problem, UC gates the decision and logging, Domo executes operational changes or alerts via its automation layer.

4. Enterprise “Genie everywhere” chat unified with Domo portals

Tie Databricks’ “Genie everywhere with Enterprise OAuth” pattern to Domo embedded experiences or custom portals, so business users get one chat surface that hits both Genie and Domo content under consistent row-level security.^{[6] [1] [4]}

- Use the Genie “everywhere” pattern (embedding Genie chat into internal portals with enterprise SSO) and co-embed Domo dashboards/cards side-by-side or via Domo Everywhere.^{[4] [6]}
- Genie uses UC metadata and the space-level knowledge store (including metric definitions and curated instructions) to answer data questions and link to relevant Domo cards for deeper exploration or scheduled reports.^{[2] [11] [1] [6] [4]}
- Enterprise OAuth ensures each user sees only the data they’re entitled to in Genie; align that with Domo PDP/row-level security using the same identity provider and group model.^{[8] [6] [4]}

The story here: “One conversational copilot that knows where both your data (Databricks) and curated stories (Domo) live, governed end-to-end by Unity Catalog and your IdP.”

5. Genie Code → Domo dashboards “as infrastructure”

Use Genie Code’s ability to generate visualizations, filters, and multi-page layouts programmatically to prototype analytic apps in Databricks, then mirror or port those patterns to Domo. ^[5] ^[6]

- Analysts or FDEs describe an analytic experience in natural language; Genie Code generates SQL, charts, filters, and layouts for Databricks dashboards. ^[5]
- The underlying SQL and structure (datasets, parameters, filter logic) is captured as code or metadata and mapped to Domo cards, collections, or App Studio modules using Domo APIs. ^[5] ^[6]
- UC stores and governs these semantic objects and metric views; Domo becomes the polished production-grade UI and distribution layer once patterns are validated. ^[2] ^[6] ^[8] ^[5]

This enables a “BI as code” narrative: Genie Code and UC define the semantic and layout skeleton; Domo implements a hardened, branded, executive experience adapted from that skeleton.

6. Unified FinOps and governance hub across UC lineage and Domo usage

Exploit Unity Catalog’s centralized governance and lineage plus Domo’s usage metrics to build an end-to-end FinOps and governance cockpit. ^[13] ^[14] ^[6] ^[8]

- Collect Unity Catalog metadata (tables, models, dashboards, permissions, lineage) and join it with Domo usage data (card views, owner, last access, page views, data volume) in Databricks. ^[14] ^[13] ^[6] ^[8]
- Use Genie Spaces over this governance dataset so stakeholders can ask NLQ questions like “Which UC tables power dashboards that nobody viewed in 90 days?” and then take remediation actions in Domo or Databricks. ^[7] ^[3] ^[6] ^[2]
- Surface the resulting rationalization/FinOps insights back in Domo as an executive governance app, closing the loop and giving you a strong platform optimization story. ^[14] ^[6] ^[8]

This resonates with CFO/COO buyers: “We can see, in plain English, which costly Databricks assets and Domo dashboards are actually used, and we can rationalize them proactively.”

7. Cross-platform RAG: Genie over UC + Domo content

Use Genie’s support for external enterprise knowledge sources and author-curated knowledge stores to blend structured data in UC with Domo documentation, playbooks, and narrative content for richer decision support. ^[9] ^[1] ^[6] ^[2] ^[4]

- Connect Genie to external stores like SharePoint, Google Drive, or Confluence where Domo report documentation, metric definitions, and operational runbooks are stored. ^[1] ^[9] ^[4]
- Curate a Genie Space where UC metric views and tables provide the quantitative ground truth, while those external docs capture the “why” and “how” around Domo dashboards,

alerts, and workflows. ^[7] ^[6] ^[1] ^[2] ^[4]

- Users can ask “Why did the margin KPI in the Domo exec dashboard change last quarter?” and Genie can respond with both actual UC-sourced metrics and links/summaries from Domo documentation and change logs. ^[3] ^[9] ^[6] ^[1] ^[2] ^[4]

This unlocks a “context-aware copilot”: not just numbers from Databricks, but the narrative context and operational SOPs that live around Domo assets.

Quick positioning angles by buyer

- Data & AI leadership: Unified semantic and governance plane (Unity Catalog) with dual consumption in Genie and Domo, reducing metric drift and BI sprawl. ^[14] ^[6] ^[2] ^[7] ^[8]
- Business executives: One chat-first interface to ask questions, see governed numbers, and jump into familiar Domo dashboards when they need more detail. ^[12] ^[6] ^[1] ^[2] ^[4]
- FinOps / platform owners: Full view of cost, usage, and lineage across Databricks and Domo, with Genie natural-language access and remediation workflows. ^[13] ^[6] ^[8] ^[14]

If you pick one of these to productize first, which buyer do you most want to win over in the next 90 days: data platform leadership, business executives, or FinOps/platform owners?
